TOTAL		50

Formula Sheet

Unit Tangent Vector $T = \frac{\vec{v}}{ \vec{v} }$	Arc Length $L = \int_a^b \vec{v}(t) dt$
---	---

Unit Normal Vector $N = \frac{T'}{ T' }$	Curvature $K = \frac{ T' }{ \vec{v} }$
--	--

Binormal Vector $B = T \times N$

Line integral of $G(x,y,z)$ over curve C parametrized by $r(t)$, $a \leq t \leq b$

$$\int_C G(x,y,z) ds = \int_a^b G(t) |\vec{r}'(t)| dt$$

Surface integral of $G(x,y,z)$ over surface Q given by $z = f(x,y)$

$$\iint_Q G(x,y,z) dS = \iint_R G(x,y,f(x,y)) \sqrt{1 + f_x^2 + f_y^2} dA$$

Fundamental Theorem of Line Integrals: If \vec{F} is a conservative vector field, then there exists a potential function f such that $\vec{F} = \nabla f$ and for any smooth curve C joining the point A to the point B we have

$$\int_C \vec{F} \cdot \vec{T} ds = f(B) - f(A)$$

Green's Theorem: If C is a closed piecewise smooth counter-clockwise oriented curve enclosing a region R and $\vec{F} = \langle M, N \rangle$ is a differentiable vector field, then

$$\oint_C \vec{F} \cdot \vec{n} ds = \iint_R \left(\frac{\partial M}{\partial x} + \frac{\partial N}{\partial y} \right) dx dy \quad \oint_C \vec{F} \cdot \vec{T} ds = \iint_R \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y} \right) dx dy$$

Stokes' Theorem: Let Q be a piecewise smooth surface oriented with normal \vec{n} and bounded by a closed curve C positively oriented in the direction of \vec{n} . The circulation of a differentiable vector field \vec{F} around C is

$$\oint_C \vec{F} \cdot \vec{T} ds = \iint_Q (\nabla \times \vec{F}) \cdot \vec{n} dS$$

Divergence Theorem: Let \vec{F} be a differentiable vector field and Q be a piecewise smooth closed surface oriented with an outward pointing normal \vec{n} and enclosing a region D . The outward flux across Q is

$$\oiint_Q \vec{F} \cdot \vec{n} dS = \iiint_D \nabla \cdot \vec{F} dV$$

1.) [5 points] Compute the curl of $\vec{F} = \langle 4x, z^3, x \cos y \rangle$.

2.) [5 points] Charmander starts at the point (10,1,4) and walks with velocity function

$$\vec{v}(t) = \langle 3t, \sin 4t, e^{2t} \rangle.$$

Find Charmander's position function $\vec{r}(t)$.

3.) [10 points] A straight piece of wire extends from the point $(2,2,3)$ to $(-3,2,5)$. The linear density in kg/m of the wire is given by

$$\rho(x, y, z) = x + y^2 z.$$

Calculate the mass of the wire.

4.) [10 points] Let S be the surface composed of all 6 sides of the box

$$0 \leq x \leq 1, \quad 0 \leq y \leq 2, \quad 0 \leq z \leq 3.$$

Compute the outward flux through S of the vector field

$$\vec{F} = \langle x^2y, 4x, 2yz \rangle.$$

5.) [10 points] Compute the surface area of the portion of the plane

$$4x - 10y + 2z = 5$$

that is inside the cylinder $x^2 + y^2 \leq 4$.

6.) [10 points] Charmander runs in a triangular path from the point (0,0) to (2,0) to (0,4) and then back to (0,0). A hurricane starts up with velocity field

$$\vec{F} = \langle 3y^2, 2xy \rangle.$$

Calculate the circulation of air around Charmander's path.
