

Consider the following signals  $x(t)$  and  $y(t)$  (on back):

(a) (1 point) The signal  $x(t)$  is

**A. an energy signal.**

B. a power signal.

(b) (4 points) Determine the energy or time-averaged power of the signal  $x(t)$ .

Note that the signal  $x(t)$  is given by

$$x(t) = \begin{cases} t + 1 & -1 \leq t < 0 \\ 1 - t & 0 \leq t < 1 \\ 0 & \text{otherwise.} \end{cases}$$

$$E_x = \int_{-\infty}^{\infty} |x(t)|^2 dt = \int_{-1}^0 (t + 1)^2 dt + \int_0^1 (1 - t)^2 dt$$

Using  $u$ -substitution with  $u = t + 1$ ,  $du = dt$ ,  $v = 1 - t$ , and  $dv = -dt$ , we have

$$E_x = \int_0^1 u^2 du - \int_1^0 v^2 dv = \int_0^1 u^2 du + \int_0^1 v^2 dv = 2 \int_0^1 u^2 du = 2 \frac{u^3}{3} \Big|_0^1 = \boxed{\frac{2}{3}}.$$

(c) (1 point) The signal  $y(t)$  is

A. an energy signal.

**B. a power signal.**

(d) (4 points) Determine the energy or time-averaged power of the signal  $y(t)$ .

Note that  $y(t)$  is periodic with fundamental period  $T_0 = 2$  and an energy content of  $2/3$  per period (as seen in part (b)). Therefore, the power of  $y(t)$  is given by

$$P_y = \lim_{T \rightarrow \infty} \frac{1}{T} \int_{-T/2}^{T/2} |y(t)|^2 dt = \frac{1}{T_0} \int_{-T_0/2}^{T_0/2} |y(t)|^2 dt = \frac{1}{2} \int_{-1}^1 y^2(t) dt = \frac{1}{2} E_x = \boxed{\frac{1}{3}}.$$
